Abstract

This template is a compact starting point for a thesis using the local kaobook setup. It keeps the structure of a complete project: front matter, parts, chapters, a bibliography, and appendices. The example chapters show the supported figure and table layouts without carrying over project specific thesis content.

3 Results	7
4 Conclusion	8
III APPENDIX	10
A Additional Material	11
A.1 Derivation Sketch	11

Part I

THESIS BODY

Start each chapter in its own file and include it from `main.tex`. This keeps the root file focused on document structure and package configuration.

1.1 Cross References

Use labels for chapters, sections, figures, tables, equations, and appendix material. For example, chapter 2 shows the figure and table patterns, while appendix A contains supporting material. Citations are handled by `biblatex`; here is a textual citation with Knuth (1984) and a parenthetical citation (Lamport, 1994).

Definition 1.1.1 (Reusable command) *A reusable command is a short macro in `macros.tex` that captures notation used throughout the thesis.*

For example, $E_{x \sim p}[x^2]$ is defined once in `macros.tex` and can then be used consistently in every chapter.

This chapter is intentionally practical: it contains the small and full-width float patterns that most thesis projects need. The figures use copied example images from the source thesis so the template shows the actual supported image workflow.

2.1 Figures

Reference regular figures with \ref: Figure 2.1 is a text-column float. With an image file, use \includegraphics with a width such as \textwidth or 0.8\linewidth.

Figure 2.2 uses the full available page width. This is useful for multi-panel figures, dense plots, or diagrams with long labels.

Figure 2.1: A regular figure. Its caption sits in the margin in the standard kao-book layout. Use this for figures that fit naturally in the text column.

Figure 2.2: A full-width figure. Use `figure*` when the content needs the text column and the margin together.

2.2 Tables

Table 2.1 is a normal text-column table.

Table 2.2 demonstrates the wide-table layout and `tabularx` for a flexible notes column.

Method	Score	Time
Baseline	0.71	12.4
Proposed	0.83	10.9

Table 2.1: A regular table for compact results. Keep column names short and put details in the caption or surrounding text.

Table 2.2: A full-width table. Use `table*` for wide result summaries or tables with explanatory columns.

Setting	Train	Valid	Test	Runtime	Notes
Small	100	20	20	1.2 min	Useful for smoke tests and examples.
Medium	1000	200	200	8.4 min	Fits comfortably in a wider table.
Large	10000	2000	2000	51.0 min	Use wide tables for many columns or longer notes.

Part II

RESULTS

Use this chapter for the core findings. A short equation can stay in the text column:

$$\mathcal{L}(\theta) = \mathbb{E}_{(x,y) \sim \mathcal{D}} [\ell(f_\theta(x), y)].$$

For equations that need more horizontal room, use the `kaobook wideequation` environment:

$$\arg \min_{\theta \in \mathbb{R}^d} \mathbb{E}_{(x,y) \sim \mathcal{D}} [\ell(f_\theta(x), y)] + \lambda \|\theta\|_2^2. \quad (3.1)$$

Discuss what the result means, then point to the supporting details in appendix A.

Conclusion

4

Summarize the thesis contribution, limitations, and the most direct next steps. Keep the conclusion self-contained enough that a reader can understand what was shown after skimming the introduction and results.

Bibliography

- Knuth, Donald E. (1984). *The TeXbook*. Addison-Wesley (cit. on p. 2).

Part III

APPENDIX

Additional Material

A

Appendices are normal chapters after `\appendix`; LaTeX changes their numbering automatically. Put derivations, extended tables, extra figures, questionnaires, or implementation details here.

A.1 Derivation Sketch

This section shows where detailed derivations can live. The main text can refer to this material without interrupting the thesis narrative.

$$V[X] = E[X^2] - E[X]^2. \quad (\text{A.1})$$
